

8. Project Demonstration Phase

Project: PocketSmart AI - Smart Budget & Recommendation Assistant

8.1 Introduction to Project Demonstration

Purpose of Demonstration

The Project Demonstration Phase presents the working PocketSmart AI application and shows how its main functions operate. The demonstration should follow the actual planner workflow documented for Home Interior, Party, and Jewelry recommendations.

Demonstration Objective

The objective is to make the project understandable to an audience by showing the user interface, entering realistic inputs, sending requests through the backend, receiving AI-generated recommendations, and reviewing the results.

Opening the Project

The presentation can begin with the Home Page, which introduces PocketSmart AI and provides access to planner modules and user actions.

Explaining the Main Idea

Before running the planners, the presenter explains that the system uses budgets, preferences, contextual information, and optional images to generate personalized recommendations.

Demonstration Flow

A clear flow is: introduce the project -> show login or registration -> select a planner -> enter inputs -> generate recommendations -> explain the results -> show dashboard or history -> summarize the system.

Page 2 - Home and Party Planner Demonstration

Home Planner Demo

The presenter selects the Home Interior Planner and enters a sample budget, room type, item requirements, and quantities. The documented examples include Living Room, Kitchen, Bedroom, lights, ceiling fans, and dining tables.

Generating Home Recommendations

The request is submitted through the Home Planner flow. The audience is shown how the backend processes the request and returns recommendations based on the budget and preferences.

Explaining Home Results

The presenter explains the recommendation cards or result layout, focusing on suggested products, details, prices, and how the results relate to the user's stated requirements.

Party Planner Demo

The presenter then selects the Party Planner and enters a total budget, guest count, event type, and venue details. The documented event examples include birthday, corporate, and wedding planning.

Generating Party Recommendations

The party request is submitted and the audience is shown suggestions related to catering, decoration, entertainment, venue, and other relevant event requirements.

Page 3 - Jewelry Planner and AI Demonstration

Jewelry Planner Demo

The presenter selects the Jewelry Budget Planner and enters a budget, occasion, and preferred style. An outfit image can be uploaded as an optional input.

Multimodal AI Demo

The demonstration explains that the Jewelry Planner can use both text and image information. The image provides additional context for considering color coordination and aesthetics.

Generating Jewelry Recommendations

The presenter submits the request and displays the generated jewelry suggestions. The results are explained in relation to the occasion, style, outfit context, and budget.

AI Recommendation Explanation

The presenter briefly describes how the Gemini AI layer interprets the supplied context and generates structured recommendations. The goal is to show the relationship between user input and AI output rather than only displaying the final result.

Comparison of the Three Planners

The presenter highlights that all three planners follow a common pattern while collecting different domain-specific inputs.

Page 4 - Authentication, Dashboard, and History Demo

Registration Demo

The demonstration can show how a new user reaches the Register page and creates an account before accessing personalized features.

Login and Logout Demo

The presenter can demonstrate login, explain that authenticated access protects relevant functions, and show logout returning the user to the login page.

Dashboard Demo

After login, the User Dashboard is shown with recent recommendations, saved queries, and personalized insights, as described in the project.

History Demo

The Recommendation History page is demonstrated to show previous recommendation queries and results for review or reuse.

Session and Token Overview

The presenter can explain at a high level that the backend contains token and session routes used for authentication, login status, session-specific data, and personalized interaction.

Page 5 - Final Presentation and Demonstration Summary

Technical Flow in the Demo

The final demonstration connects the visible interface to the backend and AI architecture: frontend form -> FastAPI route -> planner logic -> Gemini AI -> recommendation response -> structured result display.

Testing Evidence

The presenter can mention that the project workflow includes real-world testing across Home, Party, and Jewelry scenarios and that AI response quality, budget adherence, platform accuracy, validation, and fallback behavior are evaluated.

Key Features to Highlight

The main features to highlight are budget-aware recommendations, three planner modules, optional outfit image analysis for jewelry, authentication and session handling, recommendation history, and structured result pages.

Demonstration Best Practices

Use simple and realistic inputs, explain each important screen while using it, avoid unnecessary navigation, and show both the input and the generated result so the audience can understand the full workflow.

Conclusion

The Project Demonstration Phase provides a practical presentation of PocketSmart AI from the user's perspective. By demonstrating the planners, AI interaction, authentication, dashboard, history, and result pages, the audience can see how the documented system works as an integrated budget and recommendation assistant.
